

LSASD Project ID: 19-0253

Final Report

Phase 2: Prioritization of PFAS Contributions to Weiss Lake

Cherokee County, Alabama & Floyd County, Georgia

Project Dates: May 20th – May 24th, 2019

Final Report Approval Date: September 10th, 2019

Project Leader: Nathan Barlet
Environmental Sampling Section
Applied Science Branch
Laboratory Services & Applied Science Division
USEPA – Region 4
980 College Station Road
Athens, Georgia 30605-2720

The activities depicted in this Final Report are accredited under the US EPA Region 4 Laboratory Services & Applied Science Division ISO/IEC 17025 accreditation issued by the ANSI-ASQ National Accreditation Board. Refer to certificate and scope of accreditation AT-1644.

SECTION B: Project Overview & Design

B1. Introduction

The headwaters of the Coosa River basin begin in Tennessee and the North Georgia Mountains as the Conasauga, Coosawattee, and Etowah Rivers. The confluence of the Conasauga and the Coosawattee form the Oostanaula River south of Dalton Georgia before converging with the Etowah River forming the Coosa River in Rome Georgia. The Coosa River flows west across the Alabama-Georgia state line and is then impounded in Leesburg Alabama to form Weiss Lake. Along with the Coosa River, Weiss Lake is fed by the Chattooga River, Little River, and numerous smaller tributaries draining a significant portion of Northeastern Alabama and Northwestern Georgia. Weiss Lake is a significant recreational and hydroelectric resource and serves as the municipal drinking water supply for the City of Centre Alabama and surrounding townships.

Weiss Lake and two of its main tributaries (i.e., Chattooga and Coosa Rivers) have historically tested positive for the presence of per- and polyfluoroalkyl substances (PFASs) via monitoring studies conducted by the Alabama Department of Environmental Management (ADEM), the Georgia Environmental Protection Division (GAEPD), and the U.S. EPA Region 4's Laboratory Services & Applied Science Division (LSASD). PFAS is a generic nomenclature encompassing a broader array of chemicals, with the most studied being perfluorooctanoic acid (PFOA) and perfluorooctanesulfonate (PFOS). The U.S. EPA has issued a Lifetime Health Advisory (LHA) for drinking water of 70 ng/L (ppt) for combined concentrations of PFOA and PFOS compounds. Extensive information regarding PFASs can be found at <http://www.epa.gov/pfas>.

Exceedances of the U.S. EPA's LHA for PFOA and PFOS have been observed at both the drinking water intakes for the City of Centre Alabama in Weiss Lake and further downstream on the Coosa River in the City of Gadsden Alabama. Data collected by ADEM from 2016 through 2019 detected both PFOA and PFOS in Weiss Lake, the Chattooga River, and on the Coosa River (upstream and downstream of the lake). Studies conducted by GAEPD in 2012 and 2016 found PFOA and PFOS compounds in the Conasauga River and the receiving waters of the Oostanaula and Coosa Rivers. A subsequent study conducted by LSASD in 2018 observed positive detections of PFOS in the upper Chattooga watershed. PFOA was not detected in the 2018 study conducted by LSASD. The 2018 sampling of the Chattooga River by LSASD was conducted during an extreme high flow event thus dilution effects may have been a factor (USEPA, 2018b).

The purpose of this study was to obtain background concentrations of PFASs for all main inputs to Weiss Lake in conjunction with streamflow measurements, to provide estimates of instantaneous mass loading rates for a broader picture of system-wide contributions of PFASs. This study included 2 vertical profiling stations and additional water quality parameters to investigate both the vertical distribution of observed PFASs within the lake water column and correlation with other contaminants of concern.

B2. Methodology

All field activities described below were conducted in accordance with the approved Phase 2: Prioritization of PFAS Contributions to Weiss Lake Sample and Analysis Plan (USEPA, 2019c), standard operating procedures and policies outlined in the Applied Science Branch Quality Assurance Project Plan (USEPA, 2018a), and LSASD's ISO/IEC 17025 accreditation issued by the ANSI-ASQ National Accreditation Board.

Study Area:

The study area for this project included Weiss Lake and all its main tributaries in Cherokee County Alabama and Floyd County Georgia (Figure 1). A total of 23 stations were assessed by LSASD personnel on the dates of May 20th – 23rd, 2019. The stations included 17 inflowing tributaries, 2 outflowing tributaries at both Weiss Lake Dams, the public drinking water intakes for Centre City and Gadsden Alabama, and 2 vertical profiling stations located on the surface of Weiss Lake. The dams are the only surface water outlets for Weiss Lake discharging directly into the Coosa River. The inflowing tributaries include 14 named rivers and streams and 3 un-named creeks with drainages adjacent to the Cherokee County Regional and Centre City Municipal Airports. See Table 1 for station IDs, descriptions and coordinates of all sampling stations.

Surface Water Sample Collection:

Surface water samples were collected on the inflowing tributaries and both public drinking water intakes listed in Table 1 and analyzed for all analytes listed in Tables 2 through 6 at the LSASD Laboratory in Athens, Georgia. Surface water samples collected at both outflowing tributaries listed in Table 1 were analyzed for the 25 PFASs listed in Table 6 only. Three additional surface water samples were collected at both vertical profiling stations (Table 1) on the surface of Weiss Lake and analyzed for PFAS analytes (Table 6) as well.

The sample container, preservation, and holding time requirements for all analytes are listed in Table 7. All surface water samples were collected in accordance with LSASD's Standard operating Procedure for Surface Water Sampling (USEPA, 2016b). Due to the water depth and stream width, surface water samples collected on the inlets of the Coosa (CRI) and Chattooga Rivers (CHR) were first collected via stainless steel buckets lowered over the bridge crossings at each site and samples were then transferred into the appropriate containers for all corresponding analyses listed in Table 7. Surface water samples collected at both outflowing tributaries (CRO01 and CRO02) and the [REDACTED] [REDACTED] were collected directly into the appropriate containers (Table 7) approximately 6-inches below the water surface, located along the streambank facing upstream into the flow. At the [REDACTED], LSASD personnel waded into the lake to a water depth approximately waist to chest height within the vicinity of the drinking water intake and collected surface water samples directly into the appropriate containers approximately 6-inches below the water surface. Surface water samples collected at both profiling stations (WL01 and WL02) were collected directly into the containers approximately 6-inches below the water surface from the edge of the boat while anchored on station. Mid- and near-bottom depth water samples were collected via high density polyethylene (HDPE) tubing fastened to a multi-parameter data sonde equipped with a depth sensor. The HDPE tubing was first purged with water at depth and then filled with sample water via peristaltic pump attached to silicon tubing. Samples were discharged directly into 15-mL polyethylene vials for PFAS analysis (Tables 6 and 7) from the HDPE tubing by retrieving the tubing back to the surface and reversing the flow on the pump in order to prevent sample water from contacting the silicon tubing. New sections of HDPE and silicon tubing were used for the collection of each depth sample at both the profiling stations. All other surface water samples were collected by wading in to a mid-channel location and directly filling the appropriate containers (Table 7) facing upstream.

Surface water and sediment samples collected for PFAS analysis were sampled via a trace level sampling technique to avoid cross-contamination of PFAS surface water samples due to sample collection and handling. This process required two field personnel for PFAS sample collection. A designated sampler handled the sample media and sample container only. A second designee operated sampling equipment and assisted with sample container packaging and labeling. Sampling equipment known or suspected to contain PFASs (e.g. Teflon® and Gore-Tex®) was avoided during sampling activities. Quality control samples which included field equipment rinse blanks, field blanks, and trip blanks were collected to account for the potential of cross-contamination. Additional quality control samples such as temperature blanks, field duplicates and matrix spike/matrix spike duplicates were collected in accordance with the LSASD Standard Operating Procedure for Field Sampling Quality Control (USEPA, 2017b) and are discussed in Section C4: Data Quality.

In-Situ Water Quality Field Measurements:

Surface water quality measurements of temperature, dissolved oxygen, specific conductance, turbidity, and pH were collected *in-situ* via YSI EXO1 multi-parameter data sondes and LaMotte 2020 turbidimeters at each site in accordance with LSASD's Standard Operating Procedure for *In-Situ* Water Quality Monitoring (USEPA, 2018c). See Table 8 for a detailed list of *in-situ* water quality parameters. *In-situ* measurements of the water quality parameters listed in Table 8 were collected at 2-foot intervals to construct a vertical profile of the water column at both Weiss Lake profiling stations (WL01 and WL02). Field measurements of turbidity at the vertical profiling stations were collected at 2-foot intervals in units of Formazin Nephelometric Units (FNUs) via the onboard optical turbidity probe. Additional measurements of field turbidity were collected at depth via peristaltic pump in association with PFAS surface water sample collection and measured using a LaMotte 2020 turbidimeter in Nephelometric Turbidity Units (NTUs). A correlation curve was constructed to convert turbidity measurements in FNUs to NTUs for the lake profiling stations. The resulting trendline was used to interpolate values of turbidity along the vertical profile in units of NTUs.

Stream Flow Measurements & Mass Loading:

Stream flow measurements were collected at each inflowing and outflowing tributary site (Table 1 and Figure 1) via acoustic doppler velocimeter (ADV) or a remotely-operated acoustic doppler current profiler (ADCP) depending on water depth and flow in accordance with LSASD's Standard Operating Procedure for Hydrological Studies (USEPA, 2016a). A Sontek Flowtracker 2 was used to collect ADV flow measurements in tributaries with wadeable cross sections. A Rio Pro 1200kHz ADCP by Teledyne RD Instruments mounted to a remotely-operated Q-Boat by Ocean Science was used in the larger or deeper tributaries for ADCP flow measurements. Field measurements of streamflow were used in conjunction with PFAS concentrations at stations with positive detections of PFAS to compute instantaneous mass loading rates in units of grams per day.

Water Quality Correlation Matrix:

Correlation matrices for all surface water quality parameters collected on the inflowing tributaries and both public drinking water intakes were computed using the non-parametric Spearman Rank Correlation method at 95% and 99% confidence levels (i.e. $\alpha=0.05$ and $\alpha=0.01$) using the *corrplot* package built in R (Wei et al., 2017). Parameters with non-detections for all stations were excluded from analysis. Only correlation coefficients with p-values less than a significance level of $\alpha=0.05$ and $\alpha=0.01$ ($P[\rho]<\alpha$) for the respective matrices are shown.

SECTION C: Results & Discussion

C1: Analytical Surface Water Quality

Per- and Poly-Fluoroalkyl Substances (PFASs):

Surface water samples were collected at all stations listed in Table 1 and analyzed for the 25 PFAS target analytes listed in Table 6. Two additional surface water samples were collected and analyzed for PFASs at the Weiss Lake profiling stations (WL01 and WL02) at mid-depth and at one foot above the sediment. A total of 8 distinct PFASs were detected at one or more of the stations assessed during this study. These included perfluorooctanoic acid (PFOA), perfluorooctanesulfonate (PFOS), perfluorobutyric acid (PFBA), perfluorobutanesulfonate (PFBS), perfluoroheptanoic acid (PFHpA), perfluorohexanoic acid (PFHxA), perfluoropentanoic acid (PFPeA), and perfluorotetradecanoic acid (PFTeDA). At least one or more PFASs were detected at 5 of the 17 inflowing tributary sampling locations listed in Table 1 which included the Coosa River (CRI), Chattooga River (CHR), Spring Creek

(SPC), Cowan Creek (COC), and the un-named drainage adjacent to the Cherokee County Regional Airport (UNT1). At least one or more PFASs were also detected in surface water samples collected at both Weiss Lake outflows (CRO01 and CRO02), both lake profiling stations (WL01 and WL02), as well as the public drinking water intakes for the cities of Gadsden and Centre (G100 and C100).

There are currently no maximum contaminant levels (MCLs) established for PFASs nationally or for the states of Georgia and Alabama. The U.S. EPA has issued a Lifetime Health Advisory (LHA) level of 70 ng/L or ppt for combined and chemical-specific concentrations of the long-chain compounds PFOA and PFOS in drinking water. The Coosa River inlet (CRI) was the only site assessed in this study with combined concentrations of PFOA and PFOS detected above the EPA's LHA at 74 ng/L. Combined concentrations of PFOA and PFOS near the EPA's LHA were also detected at the City of Centre public drinking water intake (C100), the Coosa River Outlet (CRO01), and the Chattooga River (CHR) at levels of 69 ng/L, 64 ng/L, and 59 ng/L, respectively. Concentrations of 33 ng/L and 32 ng/L for PFOS alone were detected at the Gadsden public drinking water intake (G100) and the Weiss Lake Dam outflow (CRO02), respectively. PFOS was also detected at both lake profiling stations with concentrations ranging from 32 – 37 ng/L for WL01 and 24 – 33 ng/L for WL02.

The short-chain compound PFBS was the only PFAS constituent detected at COC and UNT1 at 44 ng/L and 36 ng/L, respectively. No PFASs were detected at or above the Minimum Reporting Limit (MRL) at stations MHC, KNC, CEC, BRB, MUC, LOB, YEC, WOC, LIR, UNT2, UNT3, or BNC.

A summary of detected PFASs and corresponding sampling stations are listed in Table 9 and shown in Figure 2. The "U" qualifier on tables and figures denotes that the analyte was not detected at or above the reporting limit. The "J" qualifier on tables and figures denotes that the identification of the analyte was deemed acceptable by the laboratory, but the reported value is an estimate. An accompanying "Q-2" qualifier denotes that the result was greater than the Minimum Detection Limit (MDL) but less than the MRL. The "Y-2" qualifier accompanying the estimate of PFTeDA detected in the duplicate sample at G100 denotes that estimates of this analyte should be used for screening purposes only. The complete analytical results, MRLs, and associated qualifiers for all analyses of PFASs are listed in Appendix A of this report. Detailed discussions of instantaneous PFAS mass loading rates, composition of detected PFAS contributions to Weiss Lake, and distribution of PFASs throughout the Weiss Lake water column can be found in Section C3 of this report.

Volatile Organic Compounds (VOCs):

Surface water samples were collected at all inflowing tributaries and both public drinking water intakes listed in Table 1 and analyzed for the VOC target analytes listed in Table 4. Positive identifications of Toluene and (*m*- and/or *p*-) Xylene were detected in samples collected on the inflowing section of the Coosa River (CRI) at concentrations below the established MRLs, and were estimated at 0.2 ppb and 0.15 ppb, respectively. A positive identification of Toluene was also detected in samples collected on Wolf Creek (WOC) at levels below the established MRL and was estimated at 0.11 ppb. These results are greater than the MDLs but less than the MRLs for these analyses, thus the reported results are estimates. The identification of the reported analytes was deemed acceptable by the Laboratory Services Branch. The detected VOCs are summarized in Table 10. The analytical results, MRLs, and associated qualifiers for all analyses of VOCs are listed in Appendix B of this report.

Semi-Volatile Organic Compounds (SVOCs):

Surface water samples were collected at all inflowing tributaries and both public drinking water intakes listed in Table 1 and analyzed for the SVOC target analytes listed in Table 3. A concentration of 14 ppb of (3- and/or 4-) Methylphenol, also known as *m*-Cresol and/or *p*-Cresol, was measured in samples collected on Mt. Hope Creek (MHC). Cresol is used for its antimicrobial and insecticidal properties in pesticides, pharmaceuticals, biotechnologies, and is a significant component in the manufacturing of Creosote. There are currently no national MCLs for *m*-Cresol and/or *p*-Cresol established by the U.S. EPA.

A positive identification of 1,4-Dioxane was detected in samples collected on Cedar Creek (CEC) below the established MRL and was estimated at 1.2 ppb. The result for 1,4-Dioxane on CEC was greater than the MDL but less than the MRL for this analyte, thus the reported result is an estimate. The identification of 1,4-Dioxane at CEC was deemed acceptable by the Laboratory Services Branch. The detected SVOCs are summarized in Table 10. The analytical results, MRLs, and associated qualifiers for all analyses of VOCs are listed in Appendix C of this report.

Polychlorinated Biphenyls (PCBs):

Surface water samples were collected at all inflowing tributaries and both public drinking water intakes listed in Table 1 and analyzed for the PCB target analytes listed in Table 3. No PCBs were detected at or above the MRLs in any surface water samples collected during this study. The analytical results, MRLs, and associated qualifiers for all analyses of PCBs are listed in Appendix D of this report.

Total Metals:

Surface water samples were collected at all inflowing tributaries and both public drinking water intakes listed in Table 1 and analyzed for a routine scan of total metals, of which the target analytes are listed in Table 2. The concentrations of detected metals are summarized in Table 10. The analytical results, MRLs, and associated qualifiers for all analyses of total metals are listed in Appendix E of this report.

Iron was detected above the National Secondary Drinking Water Standard (SDWR) for iron of 300 µg/L at the Kings Creek (KNC), Mt. Hope Creek (MHC), un-named tributary #1 (UNT1) and Big Nose Creek (BNC) sampling stations. Secondary drinking water standards are recommended guidelines prescribing non-enforceable limits for contaminants that may cause undesirable effects at or above those levels, such as taste, odor, visual aesthetics and/or water treatment issues. Additionally, iron was detected above the freshwater aquatic life chronic exposure limit (CEL) for iron of 1000 µg/L at the Mud Creek (MUC), un-named tributary #3 (UNT3), and Yellow Creek (YEC) sampling stations. At high concentrations in aerated waters iron can form precipitates that may be detrimental to benthic organisms and the health of fish and other aquatic life.

Manganese was also detected above the SDWR of 50 µg/L at 10 of the 17 inflowing tributary stations which included Chattooga River (CHR), Kings Creek (KNC), Mt. Hope Creek (MHC), Mud Creek (MUC), Big Nose Creek (BNC), Cowan Creek (COC), Wolf Creek (WOC), Yellow Creek (YEC), and un-named tributaries #1 and #3 (UNT1 and UNT3). Additionally, manganese was also detected above the SDWR of 50 µg/L at the Gadsden public drinking water intake (G100).

Nutrients:

Surface water samples were collected at all inflowing tributaries and both public drinking water intakes listed in Table 1 and analyzed for the nutrient target analytes listed in Table 5. These analytes included ammonia as nitrogen, nitrate/nitrite as nitrogen, total phosphorus, sulfate, and Total Kjeldahl Nitrogen (TKN). The concentrations of detected nutrients are summarized in Table 10. The analytical results, MRLs, and associated qualifiers for all nutrient analyses are listed in Appendix F of this report.

The EPA has proposed ambient water quality aquatic life CELs for total phosphorus of 8 µg/L for rivers and streams, and 10 µg/L for lakes located within nutrient ecoregion XI, defined as the central and eastern forested uplands (USEPA, 2000a; USEPA, 2000b). Concentrations of total phosphorus were detected above the recommended CEL for rivers and streams at the public drinking water intake on the Coosa River in Gadsden (G100) and at 15 of the 17 inflowing tributary stations, which included Cedar Creek (CEC), Chattooga River (CHR), Coosa River inlet (CRI), Kings Creek (KNC), Mt. Hope Creek (MHC), Mud Creek (MUC), Spring Creek (SPC), un-named tributary #3 (UNT3), Big Nose Creek (BNC), Cowan Creek (COC), Locust Branch (LOB), un-named tributary #1 (UNT1), un-

named tributary #2 (UNT2), and Yellow Creek (YEC). Total phosphorus was also detected above the recommended CEL for lakes at the public drinking water intake for the City of Centre located on Lake Weiss (C100). The Chattooga River (CHR) had the highest concentrations of total phosphorus at 180 µg/L.

Classical Inorganics:

Surface water samples were collected at all inflowing tributaries and both public drinking water intakes listed in Table 1 and analyzed for the classical inorganic target analytes listed in Table 5. These analytes included chloride, total dissolved solids, total suspended solids, sulfate, and hardness calculated as calcium carbonate. The concentrations of detected classical inorganics are summarized in Table 10. The analytical results, MRLs, and associated qualifiers for all classical inorganic analyses are listed in Appendix G of this report.

C2. Field Measurements

Stream Flow Measurements:

Stream flow measurements for all inflowing and outflowing tributaries (Table 1) along with the method used (i.e. ADCP or ADV) are listed in Table 11. Flow measurements were collected via ADCP or ADV depending on the velocity, depth, and width of the stream. The flows measured in this study ranged from the lowest at 0.01 ft³/s at the un-named tributary draining Centre Municipal Airport to the highest flow of 3583.21 ft³/s on the inlet of the Coosa River. The outlets from Weiss Lake were measured at 337.74 ft³/s at the overflow (CRO01) and 8516.13 ft³/s at Weiss Lake Dam (CRO02). Alabama Power had released water to meet full electricity generation demands during the time flow measurements were being conducted at the Weiss Lake Dam site (CRO02). Due to flow regulation, the flow measured at CRO02 represents the maximum level and can fluctuate between no flow and the value measured, depending on the number of turbines being used. Flow measurements were not collected at Brushy Branch (BRB) and the un-named tributary draining the Cherokee County Regional Airport (UNT1) due to no observable flow present at the time of sampling. Flow measurements collected on Mud Creek (MUC), Locust Branch (LOB), Big Nose Creek (BNC), and the un-named tributaries draining the eastern and western areas surrounding the Centre Municipal Airport (UNT2 and UNT3) were outside standard quality assurance criteria for the methods used, thus the reported values in Table 11 are estimates. Lake levels were near full pool elevations during the period of sampling causing back-water effects and low velocity conditions on the shallow gradient tributaries flowing into the southern perimeter of Lake Weiss. Quality assurance criteria and flow measurement uncertainty for ADCP and ADV measurements are discussed in Section C.4 of this report.

In-Situ Water Quality:

Instantaneous measurements of temperature, pH, specific conductance, dissolved oxygen, and turbidity were collected at each inflowing and outflowing tributary station, including both public drinking water intakes, and are summarized in Table 12. The pH measurement collected at the Centre City public drinking water intake (C100) was 8.85 S.U., which is outside Alabama's freshwater ambient water quality criteria of 6 – 8.5 S.U. The elevated pH observed at C100 was most likely caused by high rates of photosynthesis, which can cause temporary increases in pH due to the uptake of dissolved carbon dioxide by primary producers. The *in-situ* measurement was collected at C100 at 13:38 in the afternoon during peak hours of solar irradiation and is further supported by the elevated concentration of dissolved oxygen (10.57 mg/L) likely resulting from photosynthesis. The dissolved oxygen concentration of 5.01 mg/L at Mud Creek (MUC) was near the lower limit of Georgia's ambient water quality criterion of 5 mg/L for warm freshwaters. This was most likely due to the low flow conditions and ponded wetland habitat observed upstream at MUC. Additionally, dissolved oxygen concentrations below Alabama's ambient water quality criteria for warm freshwaters

set at 5.5 mg/L, and 4 mg/L for extreme natural conditions, were also observed at the un-named tributaries draining the Cherokee County Regional Airport (UNT1) and Centre City Municipal Airport (UNT3) at 5.13 mg/L and 3.38 mg/L, respectively. The low levels of dissolved oxygen measured at UNT1 and UNT3 can also be attributed to low flow or stagnant conditions.

In-situ water quality measurements of temperature, pH, specific conductance and turbidity were collected at 2-foot intervals to construct profiles of the Weiss Lake water column at WL01 and WL02, which are summarized in Table 13. Measurements of pH collected near the surface were above Alabama's water quality criteria upper limit of 8.5 at both stations, ranging from 8.95 – 9.01 mg/L at WL01 and 8.58 – 8.80 mg/L at WL02. These observations are also consistent with high rates of photosynthesis supported by elevated levels of dissolved oxygen measured near the lake surface, ranging from 11.05 – 11.68 mg/L at WL01 and 9.87 – 10.80 mg/L at WL02. Dissolved oxygen concentrations below Alabama's lower limits for water quality criteria, ranging from 3.78 – 4.86 mg/L at WL01 and 5.22 – 5.41 mg/L at WL02 were observed at depths of 12 – 20 ft and 26 – 30 ft, respectively. The lower levels of dissolved oxygen measured at the near bottom depths at both lake profiling stations is attributed to lake stratification and is discussed further in Section C3.

C3. Computations & Analyses

Mass Loading Rates:

Mass loading rates were calculated in grams per day for all detected PFASs (e.g. PFOA, PFOS, PFBA, PFBS, PFHpA, PFHxA, and PFPeA), combined concentrations of PFOA and PFOS, and a summation of total PFASs for all corresponding tributaries. Computed mass loading rates and detected concentrations of PFASs are summarized in Figure 2.

The inflowing Coosa River (CRI) had the largest mass loading rate into the Weiss Lake system for both total PFASs and combined PFOA and PFOS, of 1902 g/day and 649 g/day, respectively. CRI also had the largest mass loading rates for all other individual compounds, except for PFPeA, which was found to be higher on the Chattooga River (CHR) despite having a significantly lower discharge. The Chattooga River was also found to be a significant contributor of PFASs to Weiss Lake, with computed mass loadings for total PFASs and combined PFOA and PFOS of 736 g/day and 73 g/day, respectively. Approximately 72% of the total inflowing PFASs were contributed by the Coosa River during the timeframe of the sampling event. However, the Chattooga River was found to contribute approximately 28% of the total inflowing PFASs into Weiss Lake with a discharge 86% lower than the main stem of the Coosa River.

Spring Creek (SPC) and Cowan Creek (COC) were also found to be minor contributors of total PFASs to Weiss Lake at 16 g/day and 1 g/day, respectively. Neither PFOA nor PFOS was detected at or above the MRL at SPC or COC. Spring Creek and Cowan Creek contributed less than 1% of the total PFAS input. PFBS was detected at the un-named tributary draining the Cherokee County Regional Airport (UNT1) at 36 ng/L (ppt). No discharge was observed at UNT1 during the time of the study, thus a mass loading rate was not calculated for this tributary.

The calculated mass loading of total PFASs and combined PFOA and PFOS to waters downstream of Weiss Lake due to releases from Weiss Lake Dam (CRO02) was 3250 g/day and 667 g/day, respectively. Additional downstream inputs were attributed to overflow into the former Coosa River channel at CRO01 with mass loadings of 159 g/day of total PFASs and 53 g/day of combined PFOA and PFOS. The mass loading rate calculated for CRO02 represents an approximate maximum which can undergo daily fluctuations between zero g/day and the value observed depending on demands for power generation and the surface water elevation of Weiss Lake.

The calculated mass loadings are flow driven due to the relatively small range of PFAS concentrations observed and represents an instantaneous snap-shot of the system. The computed mass loadings should not be interpreted as a true mass balance due to additional factors such as seasonal variability and potential sources or sinks outside the scope of

this study. The latter include adsorption or releases of PFASs from lake or riverine sediments, bioaccumulation into aquatic food chains and subsequent human and wildlife populations, and transformation of intermediate precursors into terminal PFAS endpoints.

PFAS Composition:

The composition of specific PFASs relative to the total PFAS concentration is summarized for each site in Figure 3. The 8 distinct compounds detected in this study belong to two separate classes which include perfluoroalkyl carboxylic acids (PFCAs) and perfluoroalkanesulfonic acids (PFSAs) with varying lengths of the associated carbon chains. The PFCAs detected in this study included the following compounds in decreasing order of carbon chain length; PFTeDA (C14), PFOA (C8), PFHpA (C7), PFHxA (C6), PFPeA (C5), and PFBA (C4). The PFSAs detected in this study included PFOS (C8) and PFBS (C4). Long-chain compounds of both PFCAs and PFSAs are considered public health priorities due to their increased residence times in humans and wildlife (CONCAWE, 2016). Both PFCAs and PFSAs have been used by industry as wetting, dispersing, emulsifying, and foaming agents to produce industrial and consumer products ranging from protective coatings for fabrics, carpets, textiles, and paper; as well as formulations of insecticides and surfactants (Wang et al., 2017).

All total of 7 distinct PFASs were detected in surface water samples collected on the Chattooga River (CHR). CHR had the highest diversity of PFASs of all the stations and largest summation of total PFAS concentrations. A total of 4 distinct compounds were detected on the Coosa River (CRI): PFOA, PFOS, PFBS, and PFPeA. Generally, the composition and relative concentrations observed in the Coosa River was reflective of those observed in the lake surface water samples (WL01 and WL02), both drinking water intakes (C100 and G100), and both Weiss Lake outflows (CRO01 and CRO02). PFBS was the most prevalent compound detected throughout the system followed by PFPeA and PFOS. Except for Spring Creek (SPC), PFBS was detected in all samples in which PFASs were found, and was the only compound detected at Cowan Creek (COC) and the un-named tributary draining Cherokee County Regional Airport (UNT1). PFBS and PFPeA are short-chain replacements for PFOS and PFOA, respectively (CONCAWE, 2016). PFOA was detected on both major tributaries (i.e. CRI and CHR) but was only detected at the Weiss Lake overflow (CRO02) and the City of Centre public drinking water intake (C100) suggesting a possible heterogenous distribution with the lake.

Lake Vertical Profiles:

Vertical profiles of the Weiss Lake water column were constructed for WL01 (i.e. near Centre public drinking water intake) and WL02 (near Weiss Lake Dam). The *in-situ* water quality profiles and corresponding concentrations of PFASs detected at the surface, mid-depth, and 1-ft above the lake bottom are visualized in Figures 4 and 5. The *in-situ* water quality measurements and detected PFAS concentrations are also tabulated in Tables 13 and 14, respectively. Profile estimations of turbidity in NTUs were calculated from the turbidimeter measurements collected at surface, mid-depth, and near bottom listed in Table 15, with the correlation curve between turbidimeter measurements and the turbidity probe (in FNUs) shown in Figure 6. Temperature slopes used to determine boundaries of thermocline layers (i.e. greater than 0.3 °C change in temperature per foot change in depth) are listed in Table 16.

PFOS was detected consistently throughout the water column at both profiling locations, ranging from 32 – 37 ng/L at WL01 and 24 – 33 ng/L at WL02. Additionally, PFBS and PFPeA were also detected throughout the water column at both profiling stations and PFHxA was detected at mid and bottom depths at WL01 only. PFBS concentrations decreased with depth from 93 to 79 ng/L at WL01 and increased with depth from 85 to 100 ng/L at WL02. A slight increase with depth in concentrations of PFPeA was observed at both stations, ranging from 40 to 60 ng/L for WL01 and 41 to 45 ng/L for WL02. Generally, no clear patterns between surface and bottom water concentrations of detected PFASs were determined and the concentrations observed should be considered relatively consistent throughout the water column.

Thermoclines were detected during *in-situ* profiling indicating that the lake was stratified during the time of sampling. The consistent concentrations of detected PFASs found in the separate water layers could suggest frequent turnover of the lake water column, releases from lake sediments, and/or precipitation of particulates containing adsorbed PFASs (e.g. suspended sediments and phytoplankton) from the epilimnion down through the metalimnion and hypolimnion.

Correlation Matrix:

Correlation matrices showing the Spearman rank correlation (ρ) between variables at significance levels of $\alpha=0.05$ and $\alpha=0.01$ are depicted in Figures 7 and 8, respectively. Spearman rank correlations with a p-value greater than the significance level ($P[\rho]>\alpha$) were deemed non-significant and are excluded from the associated matrices. The sign of the Spearman rank correlation refers to a positive or negative relationship between the corresponding variables. A statistically significant Spearman rank correlation means two variables are concordant (i.e. ordered in the same way) and does not directly indicate a causal relationship. Thus, statistically significant correlations shown in Figures 7 and 8 should be interpreted with caution.

Concentrations of total PFASs had the strongest relationship with PFPeA ($\rho=0.88, p<0.01$) followed by PFBS ($\rho=0.87, p<0.01$), PFOS ($\rho=0.81, p<0.01$), PFOA ($\rho=0.73, p<0.01$), and PFHxA ($\rho=0.51, p<0.05$). These correlations are reflective of the order of their prevalence throughout the Weiss Lake system as depicted in the comparison of PFAS compositions in Figure 3. Strong positive correlations observed between the majority of the individual PFASs may suggest common sources. The group of PFCAs detected only on the Chattooga River and Spring Creek (i.e. PFBA, PFHpA, and PFHxA) were correlated with PFOA and PFPeA but not with the two PFSA compounds (PFOS and PFBS). This may be due to statistical limitations of the data set caused by the large amount of non-detections.

Statistically significant correlations between PFASs and other water quality constituents included sulfate (SO_4), total phosphorus (TP), barium, potassium, sodium, and pH. The only statistically significant correlations observed at a significance level of $\alpha=0.01$ were sulfate (SO_4) and total phosphorus (TP) with the strongest relationship occurring between sulfate and PFBS ($\rho=0.67, p<0.01$). No multicollinearity between sulfate and other water quality constituents was observed, suggesting that sulfate may be a strong predictor variable warranting further investigation. Elevated concentrations of PFASs, sulfate, and total phosphorus observed in the Chattooga River (CHR) relative to the other tributaries may be driving the correlations between these variables.

C4. Data Quality

Equipment Decontamination & Preparation:

All sampling containers were certified and managed in accordance with the LSASD Standard Operating Procedure for Equipment Inventory and Management (USEPA, 2017a). Equipment used for collecting samples to be analyzed for PFASs (i.e. stainless-steel buckets and HDPE tubing) were washed using Luminox® in warm tap water, rinsed with PFAS-free water, air-dried on clean plastic sheets and sealed in clean plastic in preparation for field use. Personnel were required to wear clean nitrile gloves during all processes of cleaning, handling, and packaging equipment. PFAS-free water was certified to be PFAS target analyte free and supplied by the LSASD laboratory in a clean HDPE container. Equipment rinse blank quality control samples were collected after the decontamination process for each type of equipment and for each lot of nitrile gloves used for sampling and submitted to the LSASD laboratory for analysis of PFAS target analytes for verification before field use. No PFAS target analytes were detected at or above the MRLs for any equipment rinse blank quality control samples and were therefore deemed acceptable within the scope of this study (Appendix H).

Field Sampling Quality Controls:

Field equipment rinse blank quality control samples were collected by rinsing each type of equipment (i.e. stainless-steel bucket and HDPE tubing) with PFAS-free water in the field, to evaluate PFAS inputs due to handling equipment in field conditions. Field blank quality control samples were also collected by transferring PFAS-free water into 15mL polypropylene vials in the field to evaluate the “clean-hands/dirty-hands” trace level sampling technique used for PFAS sample collection. Additionally, trip blank quality control samples provided by the LSASD laboratory were stored in each sample cooler for each batch, to account for PFAS and VOA inputs during sample storage and transport. No PFAS or VOA target analytes were detected at or above the MRLs for any field quality control samples and were therefore deemed acceptable for the scope of this study (Appendices A, B, and H).

Temperature blanks were placed inside each cooler and measured upon arrival to the LSASD laboratory. Due to the volume of samples collected, surface water samples were submitted to the LSASD laboratory in three separate batches. Temperature blanks accompanying sample batches received by the lab on May 22 and the morning of May 23 were recorded at 0.7°C and 1.0°C, respectively. The temperature blank stored with the third and last batch of samples submitted to the lab on the afternoon of May 23 was recorded above the 4.0°C threshold at 4.4°C. This minor deviation is deemed acceptable by the LSASD laboratory since these samples were collected on that same morning of May 23 and were still in the process of cooling.

A duplicate sample was collected on the inlet of the Coosa River (CRI) and submitted to the LSASD laboratory for analysis of all analytes targeted for this study (Tables 2 through 6). An additional duplicate sample was also collected at the Gadsden public drinking water intake (G100) and analyzed for the VOC and PFAS target analytes listed in Tables 4 and 6. The duplicate results for all detected analytes along with the calculated relative percent differences (RPDs) are listed in Tables 17 and 18 for CRI and G100, respectively.

In-Situ Water Quality Calibration & Verification:

Multi-parameter data sondes and turbidimeters used to collect *in-situ* water quality measurements were maintained, calibrated, and verified in accordance with the LSASD Standard Operating Procedures for *In-Situ* Water Quality Monitoring (USEPA, 2018c). Calibrations and end-check verifications performed on all parameters measured for the duration of the study were within the acceptable ranges in accordance with LSASD’s Calibration and End-Check Acceptance Criteria (SESDFORM-060-R0).

Flow Measurement Uncertainty:

Slow velocities were observed on tributaries flowing into the southern perimeter of Weiss Lake due to a shallow surface water elevation gradient caused by high lake levels during the period of sampling. Shallow water depths, slow velocities, turbulent conditions, or a combination of these factors can significantly increase the uncertainty of acoustic measurements of open channel flow. LSASD field personnel were unable to collect stream flow measurements at Brushy Branch (BRB) and the un-named tributary draining Cherokee County Regional Airport (UNT1) due to extreme low flow conditions. Stream flow measurements collected at Mud Creek (MUC), Locust Branch (LOB), Big Nose Creek (BNC), and the unnamed tributaries draining the eastern and western edges of Centre Municipal Airport (UNT2 and UNT3) were outside acceptable quality criteria and are flagged with a “J” as these reported values are estimates (Table 11). Stream flow measurements collected on MUC, BNC, UNT2, and UNT3 were made via acoustic doppler velocimeter (ADV) and had total measurement uncertainties greater than 5%. Additionally, total flow measurements with repetitive discharge measurements below the recommended 10% were unattainable at BNC. Measurement of 4 replicate transects made via acoustic doppler current profiler (ADCP) with a recommended average difference in flow of less than 10% was unattainable on LOB.

C5. Conclusions

At least one or more PFASs were detected at 11 of the 23 stations assessed during this study. A total of 8-distinct PFASs were positively identified in surface water samples collected in the Weiss Lake system and its supporting tributaries. Short-chain replacements for PFOA and PFOS (i.e. PFPeA and PFBS, respectively) were the most prevalent compounds detected during this study. The Coosa River flowing from the Georgia-Alabama state border had the highest instantaneous mass loading of both total PFASs (~72%) and combined PFOA and PFOS (~90%) during the time of this study. This was followed by the Chattooga River which comprised roughly a quarter of the total PFAS input to Weiss Lake with a flow 7 times lower than that of the Coosa River. The highest concentration of total PFASs and the most diverse composition, with 7-distinct compounds, were also observed on the Chattooga River. A combined concentration of PFOA and PFOS was detected above the U.S. EPA's Lifetime Health Advisory (LHA) of 70 ng/L on the inflowing Coosa River at 74 ng/L. Combined concentrations of PFOA and PFOS were also detected below but close to the Lifetime Health Advisory at the Centre City public drinking water intake, on the outflowing Coosa River, and the Chattooga River at 69 ng/L, 64 ng/L, and 59 ng/L, respectively. PFOS only was also identified at the outflowing Weiss Lake Dam and the Gadsden public drinking water intake. PFASs detected at the Weiss Lake profiling stations were found to be evenly distributed throughout the water column despite evidence that the lake was stratified during the sampling period. Computed correlation matrices indicate sulfate along with total phosphorus, barium, potassium, sodium, and pH as potential predictor variables for the presence of PFASs in this system and may warrant further investigation. The snap-shot of the Weiss Lake system provided by the instantaneous mass loadings derived from this study indicates that the Coosa and Chattooga Rivers are the most significant contributors of observed PFOA and PFOS concentrations to the receiving waters of Weiss Lake and associated public drinking water intakes in Centre City and Gadsden, Alabama. Furthermore, the relatively even distribution of detected PFASs throughout the stratified water column suggests inputs from both contaminated surface water and sediment may play important roles in the ambient PFAS concentrations observed in the lake. Background concentrations of PFASs associated with Weiss Lake sediments are currently unknown.

Qualifiers:

U Analyte not detected at or above the reporting limit.

J The identification of the analyte is acceptable; the reported value is an estimate.

Q-2 Result greater than MDL but less than MRL.

Footnotes:

¹ MCLs and SDWRs are referenced from the 2018 Edition of the Drinking Water Standards and Health Advisories Tables (USEPA, 2018d).

² AELs and CELs are referenced from the National Recommended Water Quality Criteria - Aquatic Life Criteria Tables (USEPA, 2019b).

³ EPA has proposed CELs for total phosphorus for rivers and streams (8 μg/L) and lakes (10 μg/L) located within nutrient ecoregion XI (USEPA, 2000a ; USEPA, 2000b).

⁴ AELs and CELs for Aluminum were calculated with EPA's Aluminum Criteria Calculator V2.0 (USEPA, 2019a) using site specific hardness, pH, with DOC set to 1 mg/L.

⁵ Values above the Secondary Drinking Water Regulation (SDWR) are highlighted in yellow.

⁶ Values above the CEL are highlighted in orange.

Table 11: Summary of Stream Flow Measurements

Calcium	µg/L	14000	14000	0.0
Iron	µg/L	180	180	0.0
Magnesium	µg/L	3700	3600	2.7
Manganese	µg/L	46	43	6.5
Potassium	µg/L	1300	1300	0.0
Sodium	µg/L	5000	4800	4.0
Strontium	µg/L	47	46	2.1
(m- and/or p-)Xylene	µg/L	0.15 J,Q-2	U	100.0
Toluene	µg/L	0.2 J,Q-2	0.1 J,Q-2	50.0

U Analyte not detected at or above the reporting limit.

J The identification of the analyte is acceptable; the reported value is an estimate.

Q-2 Result greater than MDL but less than MRL.

Table 18: Relative Percent Difference (RPD) of Duplicate Samples Collected at G100

Analyte	Units	G100	G100 (dup)	RPD (%)
Perfluorobutanesulfonate (PFBS)	ng/L	82	84	2.4
Perfluorooctanesulfonate (PFOS)	ng/L	33 J,Q-2	47	42.4
Perfluoropentanoic acid (PFPeA)	ng/L	42	37 J,Q-2	11.9
Perfluorotetradecanoic acid (PFTeDA)	ng/L	U	37 J,Q-2,Y-2	100.0

U Analyte not detected at or above the reporting limit.

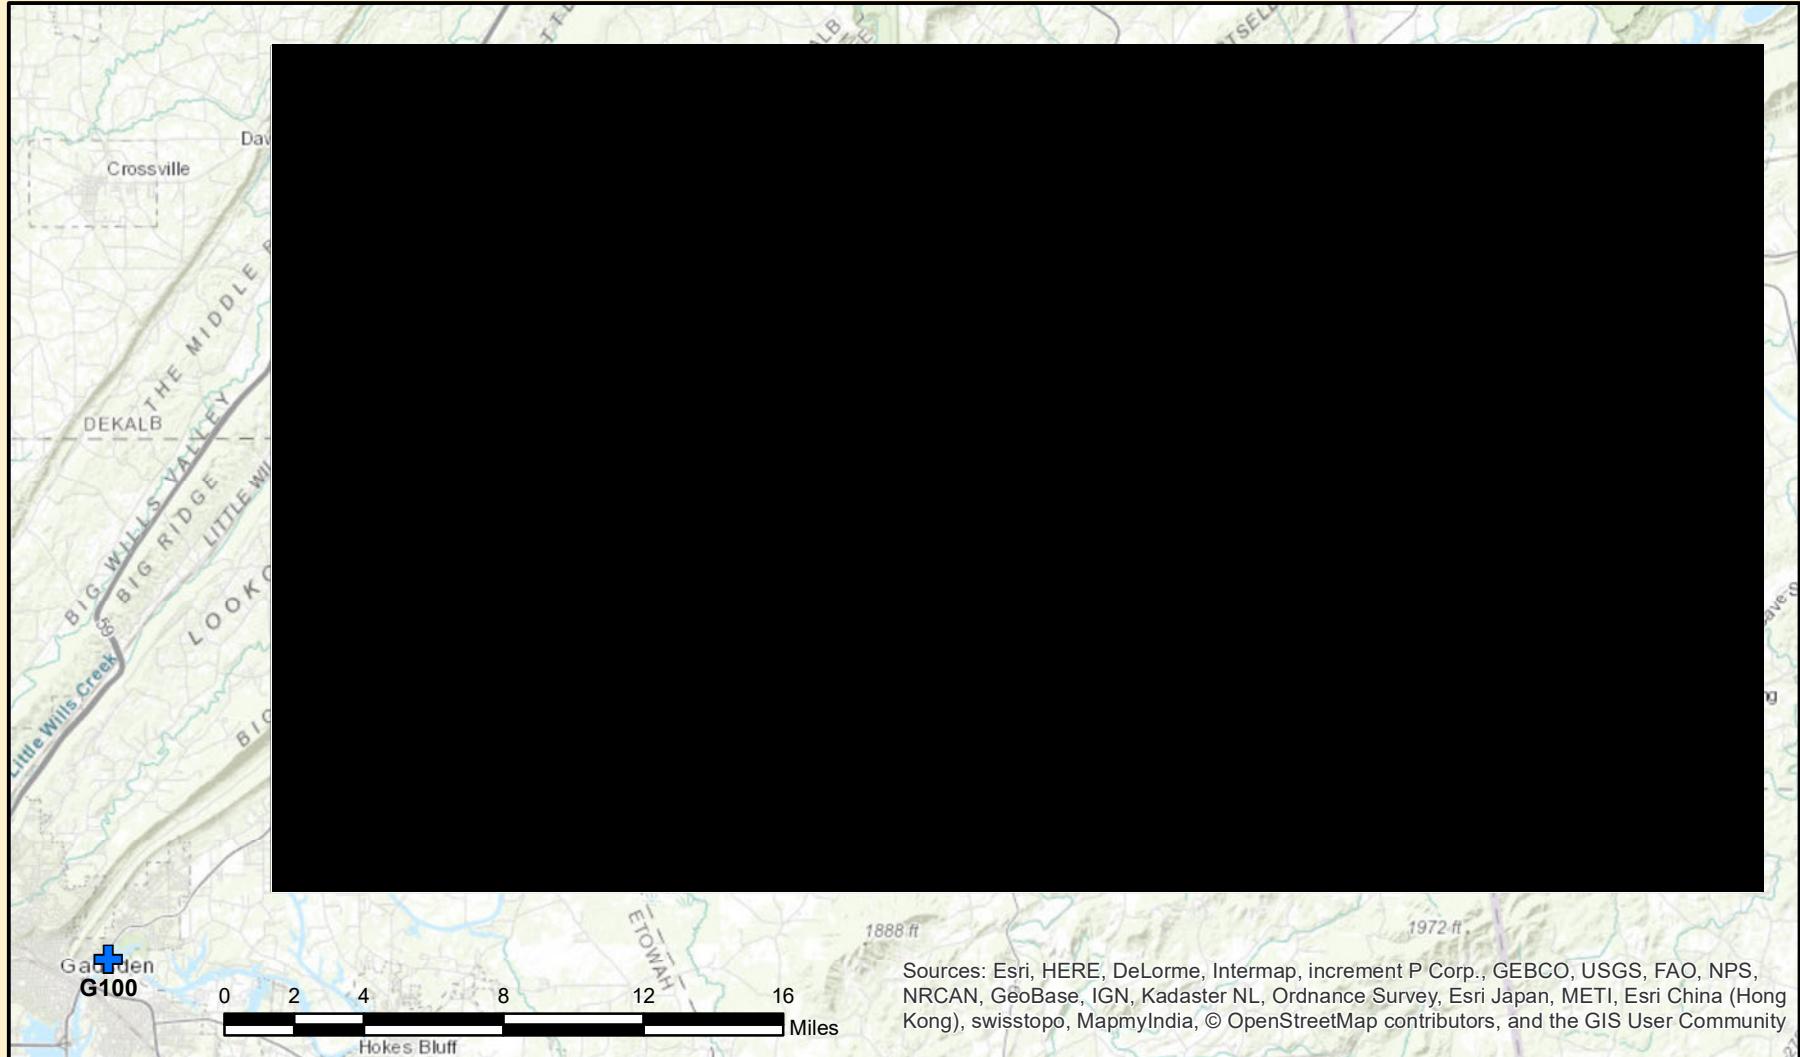

J The identification of the analyte is acceptable; the reported value is an estimate.

Q-2 Result greater than MDL but less than MRL.

Y-2 Data should be limited to screening purposes only.

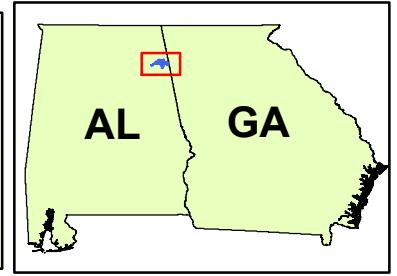

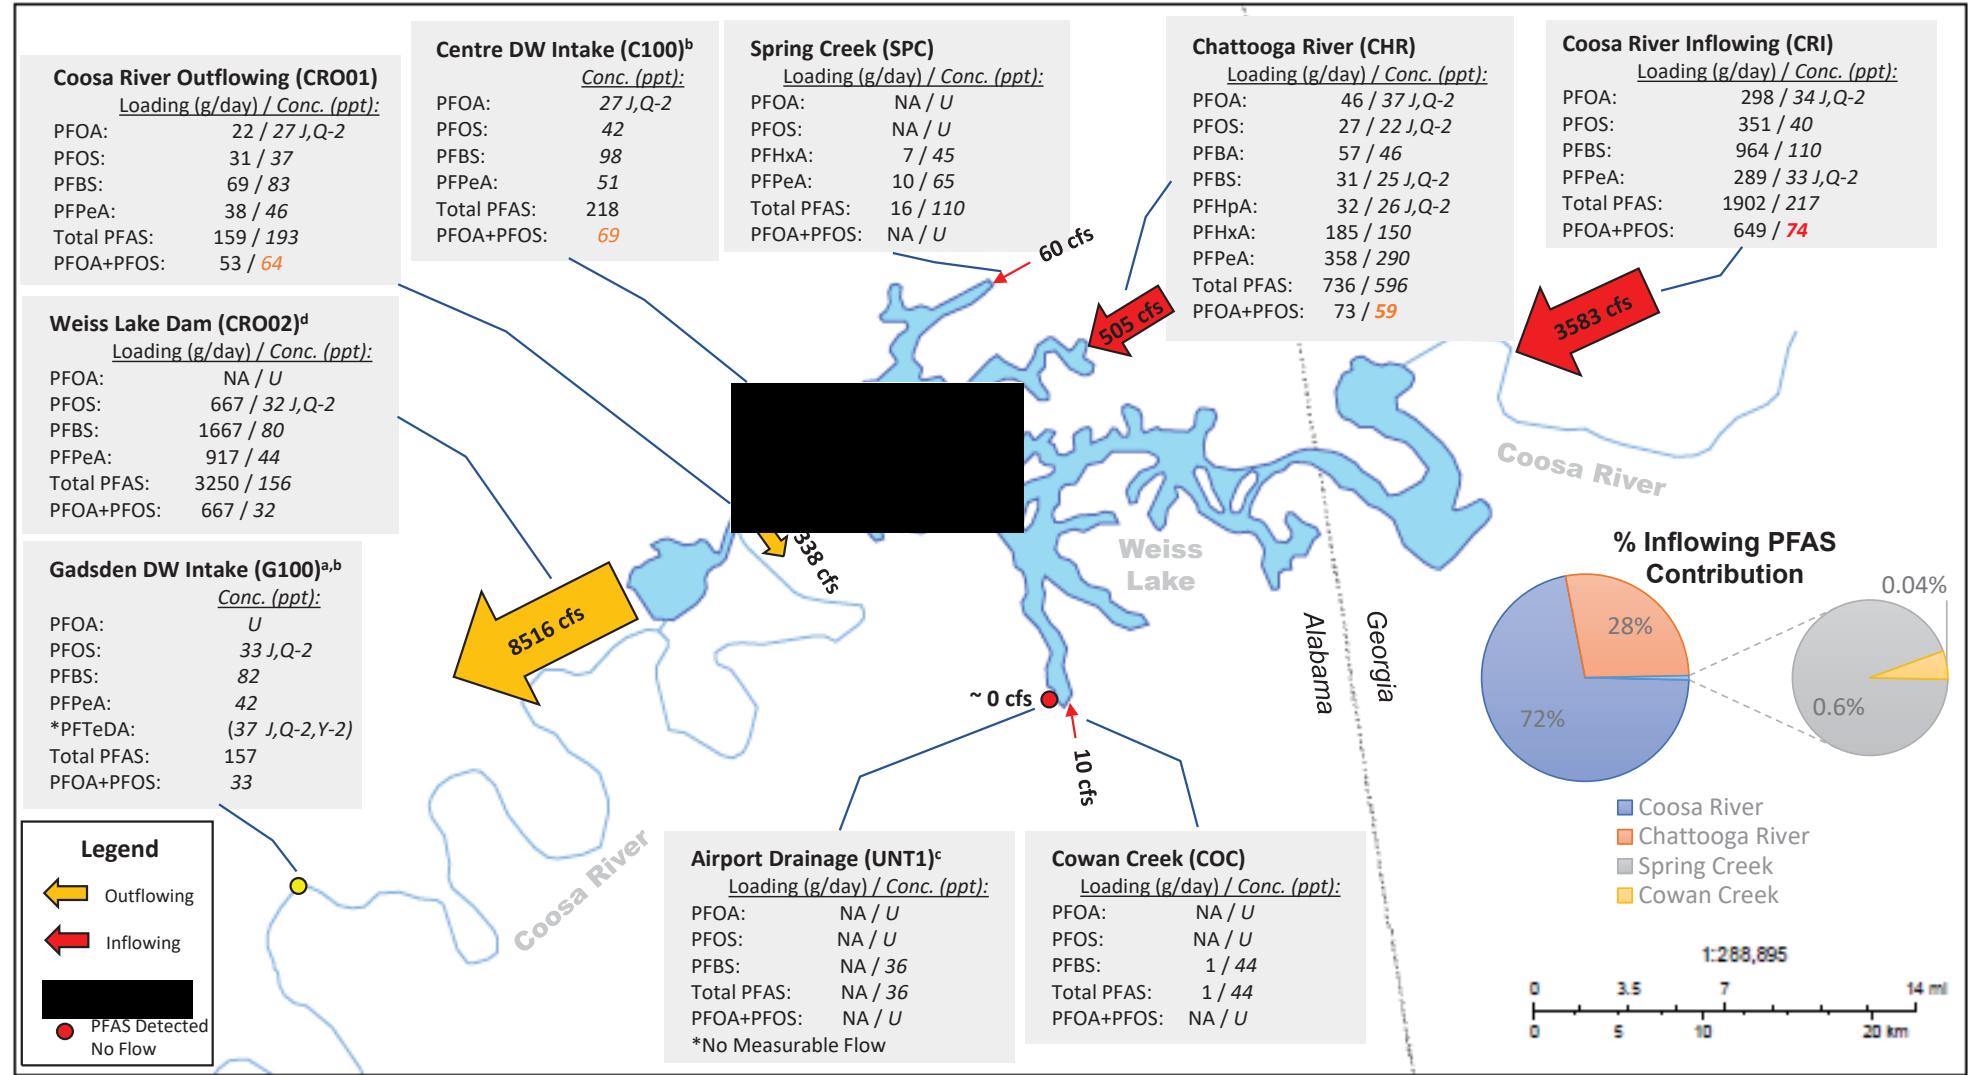

Figure 2: PFAS Mass Loading Rates

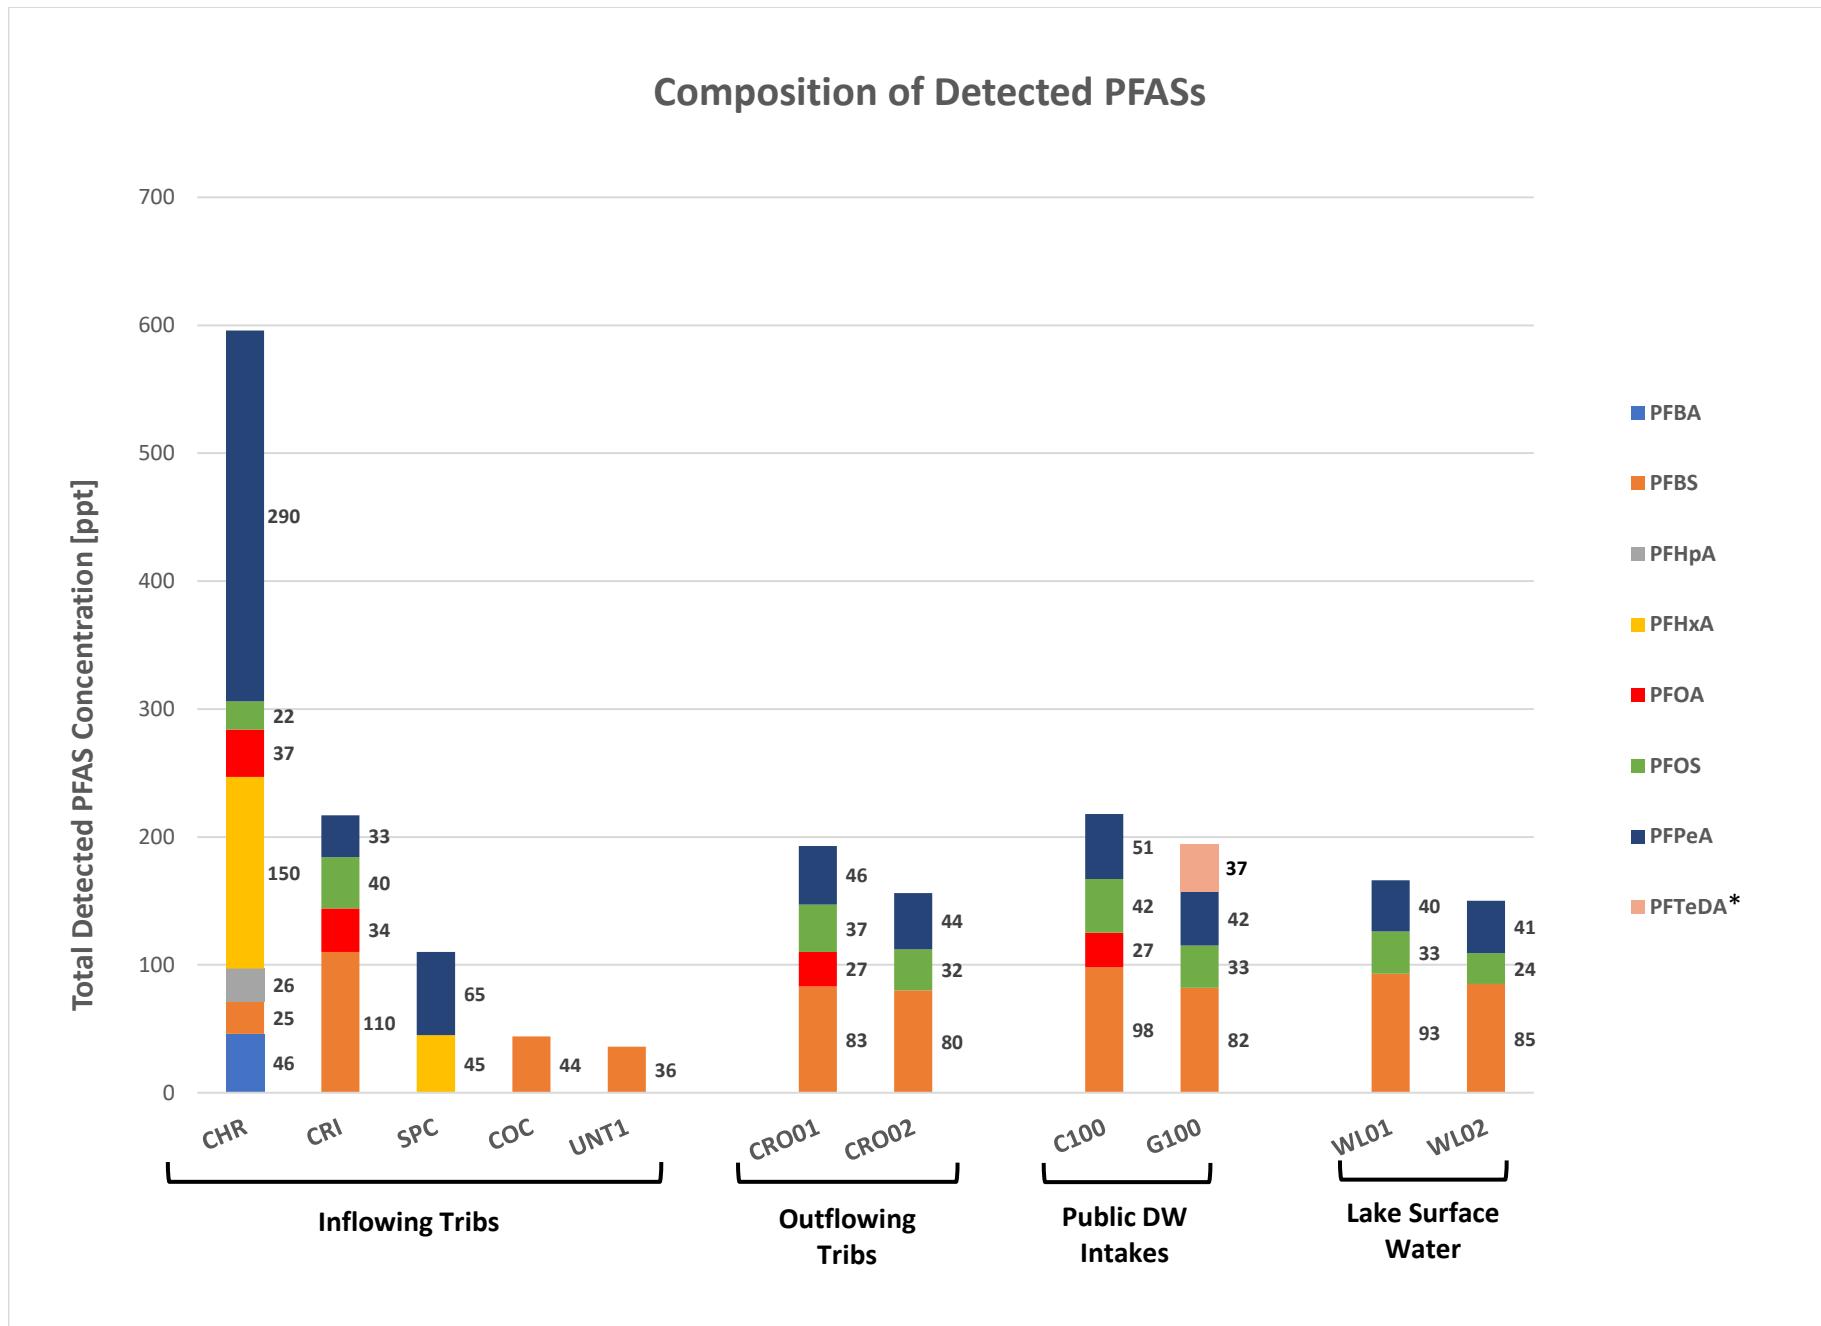

^a PFTeDA was detected in a duplicate sample collected at G100. This value is an estimate and should be limited to screening purposes only.

^b Flow was not measured at the drinking water intakes (i.e. C100 and G100). PFAS concentrations are reported only.

^c No observable flow was present at UNT1 during the sampling period. PFAS mass loading rates for UNT1 were unattainable.

^d Flow at Weiss Lake Dam was at maximum for power generation at the time of the study. This value represents a maximum between 0 cfs and ~8500 cfs depending on power demands.

Figure 3: Percent Composition of PFASs

* PFTeDA was detected in a duplicate sample collected at G100. This value is an estimate and should be limited to screening purposes only.

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Jeffrey Hendel
LSB Organic Chemistry Section Chief

THRU: Sandra Aker, Chief
Laboratory Services Branch

TO: Nathan Barlet

This data report is being reissued. Some or all of these results were previously reported. Please substitute the corrected results for those results previously reported. Please refer to the Report Narrative for more details.

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

Semi Volatile Organics (SVOA)

PFAS

ASBPROC-800PFAS (Water)

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Region 4 Laboratory Services and Applied Science Division
980 College Station Road, Athens, Georgia 30605-2700
D.A.R.T. Id: 19-0253
Project: 19-0253, PFAS Phase 2 - Reported by Jeffrey Hendel

Report Narrative for Work Order: E192104 Analysis: SVOA

The compounds Perflurotetradecanoic acid (PFTeDA) and N-ethyl-N-((heptadecafluoroctyl)sulfonyl)glycine (N-EtFOSAA) were not reported with the original data since these two compounds do not meet the QA requirements of LSB's quality system. The project requested that these two compounds to be reported anyway. As a result, the data for the work order E192104 are being re-reported to contain results for these two compounds. The results for these two compounds are qualified "Y-2" (use for screening purposes only) since they do not meet LSB quality system requirements. The end user of the data should use the results for these two compounds with caution since the laboratory cannot defend the reported result. This report replaces E192104 SVOA FINAL 07 08 19 1438.

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- Q-2 Result greater than MDL but less than MRL.
- QC-1 Analyte concentration low in continuing calibration verification standard
- QL-1 Laboratory Control Spike Recovery less than method control limits
- OS-3 Surrogate recovery is lower than established control limits.
- Y-2 Data should be limited to screening purposes only

ACRONYMS AND ABBREVIATIONS

CAS	Chemical Abstracts Service
	Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.
MDL	Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
MRL	Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
TIC	Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO	ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.
	Refer to the certificate and scope of accreditation AT-1644 at: http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

Notes and Definitions for QC Samples

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- MRL-2 MRL verification for Non-Potable Water matrix
- Q-2 Result greater than MDL but less than MRL.
- QC-1 Analyte concentration low in continuing calibration verification standard
- QL-1 Laboratory Control Spike Recovery less than method control limits
- Y-2 Data should be limited to screening purposes only

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Jeffrey Hendel
LSB Organic Chemistry Section Chief

THRU: Sandra Aker, Chief
Laboratory Services Branch

TO: Nathan Barlet

This data report is being reissued. Some or all of these results were previously reported. Please substitute the corrected results for those results previously reported. Please refer to the Report Narrative for more details.

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

Semi Volatile Organics (SVOA)

PFAS

ASBPROC-800PFAS (Water)

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Region 4 Laboratory Services and Applied Science Division
980 College Station Road, Athens, Georgia 30605-2700
D.A.R.T. Id: 19-0253
Project: 19-0253, PFAS Phase 2 - Reported by Jeffrey Hendel

Report Narrative for Work Order: E192105 Analysis: SVOA

The compounds Perflurotetradecanoic acid (PFTeDA) and N-ethyl-N-((heptadecafluoroctyl)sulfonyl)glycine (N-EtFOSAA) were not reported with the original data since these two compounds do not meet the QA requirements of LSB's quality system. The project requested that these two compounds to be reported anyway. As a result, the data for the work order E192105 are being re-reported to contain results for these two compounds. The results for these two compounds are qualified "Y-2" (use for screening purposes only) since they do not meet LSB quality system requirements. The end user of the data should use the results for these two compounds with caution since the laboratory cannot defend the reported result. This report replaces E192105 SVOA FINAL 07 05 19 1013.

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

U	The analyte was not detected at or above the reporting limit.
CR	No MDL value established for analyte
J	The identification of the analyte is acceptable; the reported value is an estimate.
Q-2	Result greater than MDL but less than MRL.
QL-1	Laboratory Control Spike Recovery less than method control limits
OS-3	Surrogate recovery is lower than established control limits.
Y-2	Data should be limited to screening purposes only

ACRONYMS AND ABBREVIATIONS

CAS	Chemical Abstracts Service Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.
MDL	Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
MRL	Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
TIC	Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO	ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.
Refer to the certificate and scope of accreditation AT-1644 at: http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd	

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Jeffrey Hendel
LSB Organic Chemistry Section Chief

THRU: Sandra Aker, Chief
Laboratory Services Branch

TO: Nathan Barlet

This data report is being reissued. Some or all of these results were previously reported. Please substitute the corrected results for those results previously reported. Please refer to the Report Narrative for more details.

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Region 4 Laboratory Services and Applied Science Division
980 College Station Road, Athens, Georgia 30605-2700
D.A.R.T. Id: 19-0253
Project: 19-0253, PFAS Phase 2 - Reported by Jeffrey Hendel

Report Narrative for Work Order: E192106 Analysis: SVOA

The compounds Perflurotetradecanoic acid (PFTeDA) and N-ethyl-N-((heptadecafluoroctyl)sulfonyl)glycine (N-EtFOSAA) were not reported with the original data since these two compounds do not meet the QA requirements of LSB's quality system. The project requested that these two compounds to be reported anyway. As a result, the data for the work order E192106 are being re-reported to contain results for these two compounds. The results for these two compounds are qualified "Y-2" (use for screening purposes only) since they do not meet LSB quality system requirements. The end user of the data should use the results for these two compounds with caution since the laboratory cannot defend the reported result. This report replaces E192106 SVOA FINAL 07 05 19 1013.

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- QL-1 Laboratory Control Spike Recovery less than method control limits
- Y-2 Data should be limited to screening purposes only

ACRONYMS AND ABBREVIATIONS

CAS	Chemical Abstracts Service
	Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.
MDL	Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
MRL	Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
TIC	Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.

Refer to the certificate and scope of accreditation AT-1644 at:
<http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd>

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Sallie Hale
OCS Analyst

THRU: Jeffrey Hendel, Chief
LSB Organic Chemistry Section

TO: Nathan Barlet

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

Volatile Organics (VOA)

Volatile organic compounds

EPA 8260C (Water)

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

980 College Station Road, Athens, Georgia 30605-2700
D.A.R.T. Id: 19-0253
Project: 19-0253, PFAS Phase 2 - Reported by Sallie Hale

DATA QUALIFIER DEFINITIONS

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- Q-2 Result greater than MDL but less than MRL.
- QC-1 Analyte concentration low in continuing calibration verification standard
- QL-1 Laboratory Control Spike Recovery less than method control limits
- QL-3 Laboratory Control Spike Precision outside method control limits
- QR-1 MRL verification recovery less than lower control limits.

ACRONYMS AND ABBREVIATIONS

CAS	Chemical Abstracts Service
	Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.
MDL	Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
MRL	Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
TIC	Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO	ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.
	Refer to the certificate and scope of accreditation AT-1644 at: http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

Notes and Definitions for QC Samples

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- MRL-2 MRL verification for Non-Potable Water matrix
- QC-1 Analyte concentration low in continuing calibration verification standard
- QL-1 Laboratory Control Spike Recovery less than method control limits
- QL-3 Laboratory Control Spike Precision outside method control limits
- QR-1 MRL verification recovery less than lower control limits.
- QR-2 MRL verification recovery greater than upper control limits.

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Jason Collum
OCS Analyst

THRU: Jeffrey Hendel, Chief
LSB Organic Chemistry Section

TO: Nathan Barlet

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

Semi Volatile Organics (SVOA)

Semivolatile organic compounds

EPA 8270D (Water)

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- Q-2 Result greater than MDL but less than MRL.
- QC-1 Analyte concentration low in continuing calibration verification standard

ACRONYMS AND ABBREVIATIONS

CAS	Chemical Abstracts Service
	Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.
MDL	Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
MRL	Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
TIC	Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.

Refer to the certificate and scope of accreditation AT-1644 at:
<http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd>

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

Notes and Definitions for QC Samples

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- MRL-2 MRL verification for Non-Potable Water matrix
- Q-2 Result greater than MDL but less than MRL.
- QC-1 Analyte concentration low in continuing calibration verification standard
- QL-2 Laboratory Control Spike Recovery greater than method control limits

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Jason Collum
OCS Analyst

THRU: Jeffrey Hendel, Chief
LSB Organic Chemistry Section

TO: Nathan Barlet

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

PCB Aroclors (PCBA)

PCB aroclors

EPA 8082 (Water)

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

D.A.R.T. Id: 19-0253
Project: 19-0253, PFAS Phase 2 - Reported by Jason Collum

DATA QUALIFIER DEFINITIONS

U The analyte was not detected at or above the reporting limit.

ACRONYMS AND ABBREVIATIONS

CAS Chemical Abstracts Service

Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.

MDL Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.

MRL Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.

TIC Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.

Refer to the certificate and scope of accreditation AT-1644 at:
<http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd>

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Floyd Wellborn
LSB Inorganic Chemistry Section Chief

THRU: Sandra Aker, Chief
Laboratory Services Branch

TO: Nathan Barlet

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

Classical/Nutrient Analyses (CNA)

Hardness as CaCO₃

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

U The analyte was not detected at or above the reporting limit.

ACRONYMS AND ABBREVIATIONS

CAS Chemical Abstracts Service

Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.

MDL Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.

MRL Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.

TIC Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.

Refer to the certificate and scope of accreditation AT-1644 at:
<http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd>

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Floyd Wellborn
LSB Inorganic Chemistry Section Chief

THRU: Sandra Aker, Chief
Laboratory Services Branch

TO: Nathan Barlet

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- QR-2 MRL verification recovery greater than upper control limits.

ACRONYMS AND ABBREVIATIONS

CAS	Chemical Abstracts Service
	Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.
MDL	Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
MRL	Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
TIC	Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

ISO ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.

Refer to the certificate and scope of accreditation AT-1644 at:
<http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd>

NR The EPA Region 4 Laboratory has not requested accreditation for this test.

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Jeffrey Hendel
LSB Organic Chemistry Section Chief

THRU: Sandra Aker, Chief
Laboratory Services Branch

TO: Nathan Barlet

This data report is being reissued. Some or all of these results were previously reported. Please substitute the corrected results for those results previously reported. Please refer to the Report Narrative for more details.

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

Semi Volatile Organics (SVOA)

PFAS

ASBPROC-800PFAS (Water)

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Region 4 Laboratory Services and Applied Science Division
980 College Station Road, Athens, Georgia 30605-2700
D.A.R.T. Id: 19-0253
Project: 19-0253, PFAS Phase 2 - Reported by Jeffrey Hendel

Report Narrative for Work Order: E191807

The compounds Perflurotetradecanoic acid (PFTeDA) and N-ethyl-N-((heptadecafluoroctyl)sulfonyl)glycine (N-EtFOSAA) were not reported with the original data since these two compounds do not meet the QA requirements of LSB's quality system. The project requested that these two compounds to be reported anyway. As a result, the data for the work order E191807 are being re-reported to contain results for these two compounds. The results for these two compounds are qualified "Y-2" (use for screening purposes only) since they do not meet LSB quality system requirements. The end user of the data should use the results for these two compounds with caution since the laboratory cannot defend the reported result. This report replaces E191807 SVOA FINAL 06 06 19 1652.

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

U	The analyte was not detected at or above the reporting limit.
J	The identification of the analyte is acceptable; the reported value is an estimate.
QC-1	Analyte concentration low in continuing calibration verification standard
QL-1	Laboratory Control Spike Recovery less than method control limits
R	The presence or absence of the analyte can not be determined from the data due to severe quality control problems. The data are rejected and considered unusable.
X-1	Non-target analyte
Y-2	Data should be limited to screening purposes only

ACRONYMS AND ABBREVIATIONS

CAS	Chemical Abstracts Service
-----	----------------------------

Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.

MDL	Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
-----	---

MRL	Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
-----	---

TIC	Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.
-----	---

ACCREDITATIONS:

ISO	ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.
-----	--

Refer to the certificate and scope of accreditation AT-1644 at:
<http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd>

NR	The EPA Region 4 Laboratory has not requested accreditation for this test.

Project: 19-0253, PFAS Phase 2 - Reported by Jeffrey Hendel

Notes and Definitions for QC Samples

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- MRL-2 MRL verification for Non-Potable Water matrix
- Q-2 Result greater than MDL but less than MRL.
- QC-1 Analyte concentration low in continuing calibration verification standard
- QC-2 Analyte concentration high in continuing calibration verification standard
- QL-1 Laboratory Control Spike Recovery less than method control limits
- R The presence or absence of the analyte can not be determined from the data due to severe quality control problems. The data are rejected and consid
- X-1 Non-target analyte
- Y-2 Data should be limited to screening purposes only

MEMORANDUM

SUBJECT: FINAL Analytical Report
Project: 19-0253, PFAS Phase 2

FROM: Jeffrey Hendel
LSB Organic Chemistry Section Chief

THRU: Sandra Aker, Chief
Laboratory Services Branch

TO: Nathan Barlet

This data report is being reissued. Some or all of these results were previously reported. Please substitute the corrected results for those results previously reported. Please refer to the Report Narrative for more details.

Attached are the final results for the analytical groups listed below. This report shall not be reproduced except in full without approval of the Region 4 laboratory. These analyses were performed in accordance with the Laboratory Services Branch's Laboratory Operations and Quality Assurance Manual (LSB LOQAM) found at www.epa.gov/region4/sesd/asbsop. Any unique project data quality objectives specified in writing by the data requestor have also been incorporated into the data unless otherwise noted in the Report Narrative. Chemistry data have been verified based on the LSB LOQAM specifications and have been qualified by this laboratory if the applicable quality control criteria were not met. Verification is defined in Chapter 5 of the LSB LOQAM. For a listing of specific data qualifiers and explanations, please refer to the Data Qualifier Definitions included in this report. The reported results are accurate within the limits of the method(s) and are representative only of the samples as received by the laboratory.

Analyses Included in this report:

Method Used:

Accreditations:

Semi Volatile Organics (SVOA)

PFAS

ASBPROC-800PFAS (Water)

D.A.R.T. Id: 19-0253
Project: 19-0253, PFAS Phase 2 - Reported by Jeffrey Hendel

Report Narrative for Work Order: E192007

The compounds Perflurotetradecanoic acid (PFTeDA) and N-ethyl-N-((heptadecafluoroctyl)sulfonyl)glycine (N-EtFOSAA) were not reported with the original data since these two compounds do not meet the QA requirements of LSB's quality system. The project requested that these two compounds to be reported anyway. As a result, the data for the work order E192007 are being re-reported to contain results for these two compounds. The results for these two compounds are qualified "Y-2" (use for screening purposes only) since they do not meet LSB quality system requirements. The end user of the data should use the results for these two compounds with caution since the laboratory cannot defend the reported result. This report replaces E1920077 SVOA FINAL 05 24 19 1705.

Sample Disposal Policy

Due to limited space for long term sample storage, LSB's policy is to dispose of samples on a periodic schedule. Air samples collected in summa canisters will be disposed of 30 days following the issuance of this report. All other sample media including original samples, sample extracts and or digestates will be disposed of, in accordance with applicable regulations, 60 days from the date of this report.

This sample disposal policy does not apply to criminal samples which are held until the laboratory is notified by the criminal investigators that case development and litigation are complete.

These samples may be held in the laboratory's custody for a longer period of time. If samples require storage beyond the 60-day period, please contact the Sample Control Coordinator by e-mail at R4SampleCustody@epa.gov.

DATA QUALIFIER DEFINITIONS

- U The analyte was not detected at or above the reporting limit.
- J The identification of the analyte is acceptable; the reported value is an estimate.
- QC-5 Calibration check standard less than method control limits.
- QL-1 Laboratory Control Spike Recovery less than method control limits
- QS-3 Surrogate recovery is lower than established control limits.
- Y-2 Data should be limited to screening purposes only

ACRONYMS AND ABBREVIATIONS

- CAS Chemical Abstracts Service
 - Note: Analytes with no known CAS identifiers have been assigned codes beginning with "E", the EPA ID as assigned by the EPA Substance Registry System (www.epa.gov/srs), or beginning with "R4-", a unique identifier assigned by the EPA Region 4 laboratory.
- MDL Method Detection Limit - The minimum concentration of a substance (an analyte) that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero.
- MRL Minimum Reporting Limit - Analyte concentration that corresponds to the lowest demonstrated level of acceptable quantitation. The MRL is sample-specific and accounts for preparation weights and volumes, dilutions, and moisture content of soil/sediments.
- TIC Tentatively Identified Compound - An analyte identified based on a match with the instrument software's mass spectral library. A calibration standard has not been analyzed to confirm the compound's identification or the estimated concentration reported.

ACCREDITATIONS:

- ISO ASB is accredited by ISO/IEC 17025, including an amplification for forensic accreditation through ANSI-ASQ National Accreditation Board.
 - Refer to the certificate and scope of accreditation AT-1644 at:
<http://www.epa.gov/aboutepa/about-region-4s-science-and-ecosystem-support-division-sesd>
- NR The EPA Region 4 Laboratory has not requested accreditation for this test.

Notes and Definitions for QC Samples

- U The analyte was not detected at or above the reporting limit.
- H-7 Recommended preparation holding time exceeded
- J The identification of the analyte is acceptable; the reported value is an estimate.
- MRL-2 MRL verification for Non-Potable Water matrix
- Q-2 Result greater than MDL but less than MRL.
- QC-5 Calibration check standard less than method control limits.
- QL-1 Laboratory Control Spike Recovery less than method control limits
- Y-2 Data should be limited to screening purposes only
